

HomeSeer LimitlessLED plug-in version 3.0

Installation.

A prerequisite is that at least one Wifi bridge/iBox with V6 API is installed and running:

This plugin supports multiple instances.

There are 2 type of V6 API WiFi boxes, with or without internal light
Configuration.

After installation you need to configure the plug-in

The screenshot shows the 'General Settings' window of the HomeSeer LimitlessLED plug-in. It contains the following fields and options:

- Debug enabled:**
- WiFi Box ip address:**
- WiFi Box ip port:**
- WiFi box type:**
- Zone 1 light or controller type:**
- Zone 2 light or controller type:**
- Zone 3 light or controller type:**
- Zone 4 light or controller type:**
- Save** button

Configure the correct IP address if the WiFi bridge and the correct port (usually 5987)

Select the WiFi box type, with or without internal light

Every WiFi bridge supports 4 zones and there are 2 type of light bulbs or led controllers in the market. The newer Led lights are V6 and the older ones V5.

Both are supported but you have to tell the plugin which API version to use. I don't have a list of all the controllers and bulbs, so you have to try both types if it doesn't work right away.

Don't forget to save your settings.

After configuration, please restart the plugin once!!!

During the start of the plugin the Zone devices (and the WiFi bridge light if you selected that option) are automatically. If you deleted 1 or all of them, they will be recreated during the next restart.

Release history. Version 3.0 → 16 April 2017 (HomeSeer V3 only)

Plug-in version 3.x is tested with Homeseer 3 version 3.0.0.68 and later and WiFi bridge API version 6

Initial version

- HS3 version plug-in, HS2 is not supported.

Future plans - You tell me.....

Please report all issues with this version to me.

Sent an email with the description of the problem to Rien.duPre@me.com

Debugging will be much easier and faster if you also can supply me with the homeseer log (with the plug- in debug level on).
